

An introduction to R and version control

https://bradduthie.github.io/talks/intro_to_R.pdf

Brad Duthie (alexander.duthie@stir.ac.uk)

16 November 2022

Tentative schedule (09:30-12:30)

Introduction to R (09:30-11:30)

- ▶ Getting started
- ▶ Useful functions
- ▶ Custom functions
- ▶ Using loops

Introduction to version control (11:30-12:30)

- ▶ Getting started
- ▶ Using GitKraken

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source
- ▶ Thousands **R packages** for specific data needs

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source
- ▶ Thousands [R packages](#) for specific data needs
- ▶ Standard programming language for statistics

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source
- ▶ Thousands [R packages](#) for specific data needs
- ▶ Standard programming language for statistics
- ▶ Write [papers](#), [slides](#), and [apps](#) in Rmarkdown

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source
- ▶ Thousands [R packages](#) for specific data needs

- ▶ Write [papers](#), [slides](#), and [apps](#) in Rmarkdown
- ▶ **Write your own solutions to problems**
- ▶ **Write your own statistical analyses**
- ▶ **Create your own plots**

How does coding (specifically R) help me as a researcher?

Practical advantages of learning and using R

- ▶ R software is entirely free and open source
- ▶ Thousands **R packages** for specific data needs
- ▶ Standard programming language for statistics
- ▶ Write **papers**, **slides**, and **apps** in Rmarkdown
- ▶ **Write your own solutions to problems**
- ▶ **Write your own statistical analyses**
- ▶ **Create your own plots**

A lot of coding is Googling solutions to get the code to work.

Write your own solutions to data organisation problems

##		SPEI	Year	Tree_ID	BAI	cumul_mn
## 1	0.34325052	1966	FR6201	645.3972	NA	
## 2	-1.35933830	1967	FR6201	470.0363	NA	
## 3	0.49415034	1968	FR6201	830.5755	NA	
## 4	-1.38069918	1969	FR6201	414.0594	NA	
## 5	0.79613295	1970	FR6201	977.4877	NA	
## 6	-0.06371012	1971	FR6201	809.8834	NA	

Calc. the cumul_mn for the BAI col. every year for each tree¹:

¹Thanks to [Tom Ovenden](#) for letting me use this example.

Write your own solutions to data organisation problems

##		SPEI	Year	Tree_ID	BAI	cumul_mn
## 1	0.34325052	1966	FR6201	645.3972	NA	
## 2	-1.35933830	1967	FR6201	470.0363	NA	
## 3	0.49415034	1968	FR6201	830.5755	NA	
## 4	-1.38069918	1969	FR6201	414.0594	NA	
## 5	0.79613295	1970	FR6201	977.4877	NA	
## 6	-0.06371012	1971	FR6201	809.8834	NA	

Calc. the cumul_mn for the BAI col. every year for each tree¹:

- ▶ Do not include *current* BAI record in cumul_mn calc
- ▶ If the Year SPEI is >1 or <-1, never include the BAI value
- ▶ If the Year - 1 SPEI is >1 or <-1, never include the BAI value
- ▶ If the Year - 2 SPEI is >1.5 or <-1.5, never include the BAI value
- ▶ If the Year - 3 SPEI is >2 or <-2, never include the BAI value

¹Thanks to [Tom Ovenden](#) for letting me use this example.

Write your own solutions to data organisation problems

Solution took 65 lines of code written in 3 custom functions.

```
tree_cumulative_mean <- function(dat){  
  trees      <- unique(dat$Tree_ID);  
  new_table  <- NULL;  
  for(tree in trees){  
    sub_dat   <- dat[dat$Tree_ID == tree,];  
    tree_cumul <- get_cumulative(tree = sub_dat);  
    new_tree   <- update_cumul(tree = sub_dat,  
                               vec  = tree_cumul);  
    new_table  <- rbind(new_table, new_tree);  
  }  
  return(new_table);  
}
```

The above is the 'outermost' function.

Create your own plots

Custom built plot [with R code](#) for an individual-based model.

¹Duthie AB, et al. (2016) *Evolution* [70\(9\)](#), 1927–1943.

Getting started in the R console

Relevant links

- ▶ Installing R (<https://www.r-project.org>)
- ▶ Installing Rstudio (<https://posit.co/downloads/>)
- ▶ Use Rstudio cloud (<https://rstudio.cloud>)
- ▶ Guided learning (<https://swirlstats.com/>)

Switch to notes to practice:

- ▶ Calculations in the R console
- ▶ Assigning variables
- ▶ Using Rscripts to run code

https://bradduthie.github.io/data/Bumpus_data.csv

Functions in R

Functions outwith base R available in packages

- ▶ [Comprehensive R Archive Network](#) includes 18000+ packages
- ▶ Packages include specialised functions
- ▶ Access with 'install.packages' and 'library'

```
install.packages("ggplot2");  
library("ggplot2");  
ggplot(data = dat, mapping = aes(x = wgt, y = totlen))  
  + geom_point();
```

Custom functions can be written in R too with the `function` function.

A custom function in R

Convert from Fahrenheit to Celsius

```
F_to_C <- function(F_temp){  
  C_temp <- (F_temp - 32) * 5/9;  
  return(C_temp);  
}
```

Highlight the whole function and run it, then you can use it.

```
F_to_C(F_temp = 70);
```

```
## [1] 21.11111
```

A custom function in R

```
F_to_K <- function(F_temp){  
  K_temp <- F_to_C(F_temp) + 273.15;  
  return(K_temp);  
}
```

Highlight the whole function and run it, then you can use it.

```
F_to_K(F_temp = 70);
```

```
## [1] 294.2611
```

Functions can go in functions

```
F_convert <- function(F_temp = 70,  
                      conversion = "Celsius"){  
  if(conversion == "Celsius"){  
    converted <- F_to_C(F_temp = F_temp);  
  }  
  if(conversion == "Kelvin"){  
    converted <- F_to_K(F_temp = F_temp);  
  }  
  return(converted);  
}
```

Convert to Kelvin again.

```
F_convert(F_temp = 70, conversion = "Kelvin");
```

```
## [1] 294.2611
```

Always good to add error messages

```
F_convert <- function(F_temp = 70,  
                      conversion = "Celsius"){  
  if(conversion != "Celsius" & conversion != "Kelvin"){  
    stop("'conversion' must be 'Celsius' or 'Kelvin'.");  
  }  
  if(is.numeric(F_temp) == FALSE){  
    stop("F_temp argument must be numeric");  
  }  
  if(conversion == "Celsius"){  
    converted <- F_to_C(F_temp = F_temp);  
  }else{  
    converted <- F_to_K(F_temp = F_temp);  
  }  
  return(converted);  
}
```

Loops in R

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Loops in R

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Suppose you want to print the following sequence:

$1, \frac{1}{2}, 3, \frac{1}{4}, \dots, 999, \frac{1}{1000}$

Loops in R

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Suppose you want to print the following sequence:

$1, \frac{1}{2}, 3, \frac{1}{4}, \dots, 999, \frac{1}{1000}$

How would you do it in R (without a loop)?

Loops in R

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Suppose you want to print the following sequence:

$1, \frac{1}{2}, 3, \frac{1}{4}, \dots, 999, \frac{1}{1000}$

How would you do it in R (without a loop)?

How would you explain what you want to do (verbally)?

Loops in R

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Suppose you want to print the following sequence:

$1, \frac{1}{2}, 3, \frac{1}{4}, \dots, 999, \frac{1}{1000}$

How would you do it in R (without a loop)?

How would you explain what you want to do (verbally)?

1. For each integer from 1 to 1000
2. If the number is odd, print it
3. If the number is even, divide by the number then print it
4. Stop when when finished printing

What is a loop?

A loop repeats the same set of instructions (i.e., 'code') across a particular set of conditions

Suppose you want to print the following sequence:

$1, \frac{1}{2}, 3, \frac{1}{4}, \dots, 999, \frac{1}{1000}$

How would you do it in R (without a loop)?

How would you explain what you want to do (verbally)?

- ▶ For $x = 1, 2, 3, \dots, 999, 1000$
 - ▶ Check if x is even
 - ▶ If x is not even, then print x
 - ▶ If x is even, then print $1/x$
- ▶ Stop when all x values have been considered

Using a for loop in R

```
for(x in 1:1000){           # The loop starts here  
  
  # Do everything within these brackets,  
  #   in the order set by 1:1000  
  #   i.e., for x = 1, then x = 2,  
  #   then x = 3, ..., then x = 1000  
  
  # Finish the loop only after 'x' has  
  #   substituted for each value  
  
} # The loop ends here
```

Using a for loop in R

```
for(x in 1:1000){           # The loop starts here

  is_odd <- TRUE;           # First assume 'x' is odd
  if(x %% 2 == 0){          # If 'x' is not odd
    is_odd <- FALSE;        # Set to false
  }                          # Now know if 'x' is odd

  if(is_odd == TRUE){       # If 'x' is odd,
    print(x);               # then print 'x'
  }else{                    # Else it is even,
    print(1/x);             # so print 1/x
  }

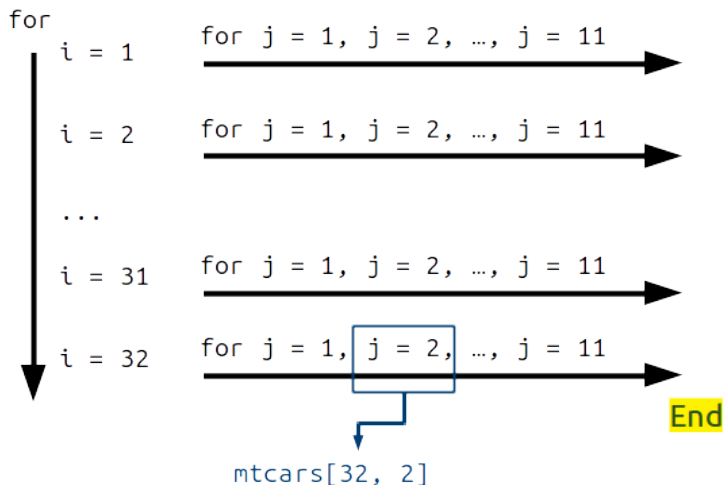

} # The loop ends here
```

Loops can be inside other loops

```
data(mtcars) # Read in R table of data about cars
rows <- dim(mtcars)[1]; # Get total mtcars rows
cols <- dim(mtcars)[2]; # Get total mtcars columns
for(i in 1:rows){          # for each row
  for(j in 1:cols){        # for each column
    print(mtcars[i, j]); # print the value
  }
}
```

Loops can be inside other loops

Start

While loops in R

Same idea as a for loop, but different termination condition

```
counter <- 200; # Set a counter outside the loop  
while(counter > 0){ # Keep looping while counter > 0  
  
  print(counter);  
  
  counter <- counter - 1; # Avoid infinite loop  
  
} # The loop ends here
```

Now practice some loops using the notes!

Using version control in R and beyond

- ▶ Understand what version control is and how it can be integrated into your work flow

Using version control in R and beyond

- ▶ Understand what version control is and how it can be integrated into your work flow
- ▶ Focus on practical skills for research
 - ▶ Learn and reinforce knowledge on how to use **key skills** effectively
 - ▶ Focus on [GitHub](#) and [GitHub Desktop](#) software

Using version control in R and beyond

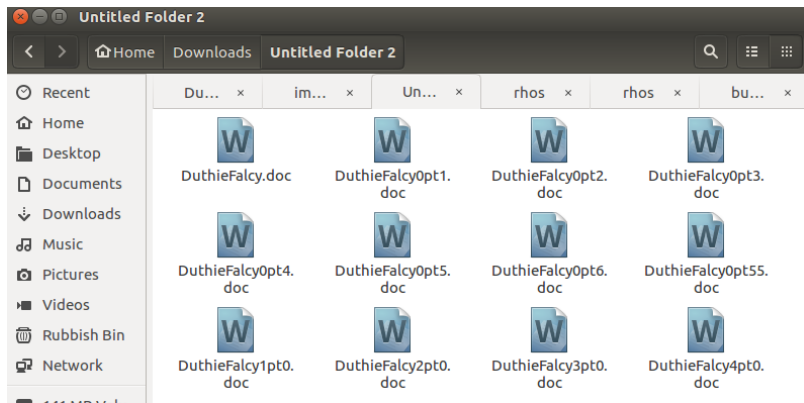

- ▶ Understand what version control is and how it can be integrated into your work flow
- ▶ Focus on practical skills for research
 - ▶ Learn and reinforce knowledge on how to use **key skills** effectively
 - ▶ Focus on [GitHub](#) and [GitHub Desktop](#) software
- ▶ Hands-on practice setting up and using version control in your own work with [accompanying notes for guidance](#)

https://bradduthie.github.io/notes/vc_notes.html

Rough outline of version control

1. What is version control, and why use it?
2. Getting set up – good file management
3. Setting up [GitHub](#)
4. The [GitHub Desktop](#) tutorial
5. Independent work using version control

What is version control, and why use it?

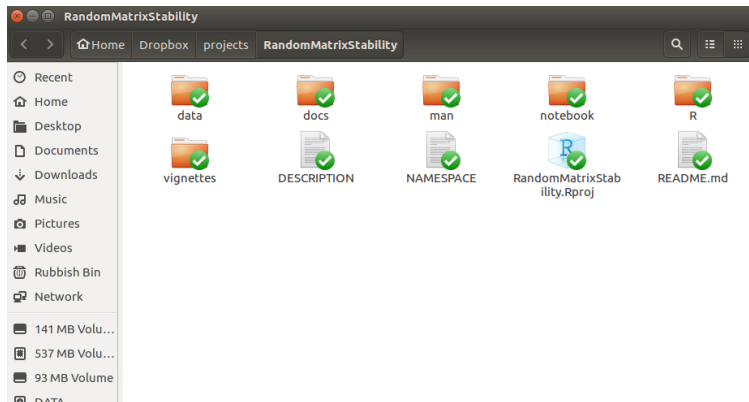

What version control software does

- ▶ Software that records changes you make to files over time
 - ▶ Manage different *versions* of files (no need to 'Save As...')
 - ▶ Recover old files, keep track of file changes
 - ▶ Collaborate with others on shared files

What version control software does

- ▶ Software that records changes you make to files over time
 - ▶ Manage different *versions* of files (no need to 'Save As...')
 - ▶ Recover old files, keep track of file changes
 - ▶ Collaborate with others on shared files
-
- ▶ **Put more intuitively**, version control takes a snapshot in time (called a '**commit**') of all the files in one of your folders (called '**repositories**')
 - ▶ Visualise changes to your files over time
 - ▶ Look at the differences between file versions
 - ▶ Record who changed files, and what they changed

Inside of a project on version control

Folders (a.k.a, 'repositories') include all data files, R code, notes, manuscript drafts, etc.

Full annotated timeline of folder changes (GitHub)

Clear breakdown of what has changed

The screenshot shows a GitHub commit diff interface. At the top, it indicates "1 commit", "1 file changed", and "1 contributor". Below this, it shows the commit message "New line" by user "bradduthie" committed 4 minutes ago. The diff view shows a single file, "README.md", with 2 additions and 0 deletions. The changes are highlighted in green. The diff shows lines 3, 4, and 5 of the original file, and lines 6 and 7 of the new file. Line 6 is a new line added, and line 7 is a new line added.
